

AI Audit Log

Project: Student Report Card Portal

This document records how AI tools were used during the development of the Student Report Card Portal and how their outputs were reviewed, modified, accepted, or rejected.

Task	AI Used	Accepted	Modified	Rejected	Why
Initial MERN Project Setup	Claude	Initial frontend and backend project structure	Folder organization and feature integration	None	Claude provided a solid starting point for rapid development.
Authentication & RBAC	Claude, ChatGPT	JWT authentication approach and role-based access ideas	API responses, user context handling, route protection	Some suggested response formats	Modified to fit project requirements and frontend architecture.
Faculty Subject Assignment	ChatGPT	Faculty-to-subject assignment workflow	Database relationships and validation logic	None	Required custom validation to ensure faculty could edit only assigned subjects.
Student Report Card Access	ChatGPT	Debugging approach and API investigation	Login response payload and student mapping logic	Initial assumptions about user-to-student mapping	Student report cards were not loading correctly because User IDs and Student IDs were different. Manual debugging was required.

Task	AI Used	Accepted	Modified	Rejected	Why
Optimistic Concurrency Control	ChatGPT	Version-based conflict detection design	Conflict resolution flow and UI handling	None	Adapted implementation to match assignment requirements and existing codebase.
Local Draft Recovery	Codex (VS Code), ChatGPT	localStorage-based recovery approach	Integration with mark entry forms	Initial non-working implementation	Early implementation failed to restore drafts correctly. Logic was revised and tested manually.
Frontend UI Improvements	Codex (VS Code)	Theme and color improvements	Styling adjustments and layout refinements	Some generated styling suggestions	Changes were applied selectively to maintain consistency across pages.
MongoDB Atlas Deployment Investigation	ChatGPT	Troubleshooting steps and diagnostics	Environment configuration testing	Assumptions that issue was application-related	Investigation showed the issue was related to Atlas connectivity/TLS rather than project code.
Documentation Preparation	ChatGPT	README structure, architecture documentation, audit log drafting	Project-specific content and technical explanations	Generic template sections	Documentation was customized to accurately reflect the final implementation.

Summary

AI Tools Used

- Claude
- ChatGPT
- Codex (VS Code)

How AI Was Used

AI tools were primarily used for:

- Initial project scaffolding
- Debugging assistance
- Feature implementation guidance
- UI improvements
- Documentation support
- Deployment troubleshooting

Human Verification

All AI-generated outputs were:

- Reviewed manually
- Tested locally
- Modified when necessary
- Rejected when inconsistent with project requirements

No AI-generated code was merged into the final project without validation and testing.
