AI Tool

Claude

Prompt

Build a full-stack MERN Student Report Card Portal with authentication, role-based access control, student management, subject management, marks entry, report cards, dashboard, and MongoDB integration.

AI Response (Trimmed)

Generated a complete MERN application structure including React frontend, Express backend, MongoDB models, JWT authentication, and CRUD operations.

Accepted

- Initial project structure
- React frontend pages
- Express backend architecture
- MongoDB model foundation

Modified

- API routes
- Database relationships
- Faculty assignment workflow
- Report card logic

Rejected

- Generic implementations that did not match assignment requirements

Why

The generated project provided a strong foundation but required customization for assignment-specific features.

AI Tool

ChatGPT

Prompt

Student login works but report cards show "Student not found". Help identify the issue.

AI Response (Trimmed)

Suggested checking the relationship between authenticated users and student records and verifying report card queries.

Accepted

- Investigation strategy
- Authentication payload review

Modified

- Login response payload
- Student mapping logic

Rejected

- Initial assumption that report card queries were broken

Why

The root cause was a mismatch between User IDs and Student IDs stored in the database.

AI Tool

ChatGPT

Prompt

Faculty can log in but cannot edit marks because the system says the faculty is not assigned to the subject.

AI Response (Trimmed)

Suggested verifying FacultySubject assignments and checking database relationships between faculty and subjects.

Accepted

- Assignment validation process
- Database inspection approach

Modified

- Faculty assignment workflow
- Subject ownership validation

Rejected

- None

Why

The issue was caused by missing faculty-subject assignment records.

AI Tool

Codex (VS Code)

Prompt

Improve the frontend theme and implement local draft recovery for mark entry forms.

AI Response (Trimmed)

Generated UI styling improvements and localStorage-based draft recovery logic.

Accepted

- Theme improvements
- localStorage strategy

Modified

- Draft restoration workflow
- Integration with existing forms

Rejected

- Initial draft recovery implementation

Why

The first implementation failed to restore drafts reliably and required manual corrections.

AI Tool

ChatGPT

Prompt

Student login is successful, but report cards are not loading correctly. Help identify the issue.

AI Response (Trimmed)

Suggested reviewing report card retrieval logic, student identification, and authentication data flow.

Accepted

- Diagnostic approach
- API response verification
- Database relationship checks

Modified

- Student mapping implementation
- Login response structure

Rejected

- Assumption that report card queries were the primary issue

Why

The actual problem was the mismatch between User IDs and Student IDs rather than the report card query itself.

Example Where AI Was Wrong

The AI initially focused on report card retrieval queries. After manual debugging, the root cause was found to be incorrect mapping between authenticated users and student records.

AI Tool

ChatGPT

Prompt

Review the completed project and prepare assignment documentation including README, architecture diagram, AI audit log, and submission materials.

AI Response (Trimmed)

Provided a documentation roadmap, README improvements, architecture recommendations, and deliverable planning.

Accepted

- Documentation structure
- Deliverable checklist
- Architecture planning

Modified

- Project-specific explanations
- Assignment-specific details

Rejected

- Generic template sections

Why

Documentation needed to accurately reflect the actual implementation rather than a generic project template.

Reflection

AI tools accelerated development, debugging, UI refinement, and documentation preparation. However, every suggestion was manually reviewed, tested, and validated before being accepted. Several outputs required modification, and some recommendations were rejected after verification. This process ensured that engineering decisions remained evidence-based rather than AI-driven.
